

SUBJECT DATASHEET

Semester:	2009/10/1
Subject:	Technical Fluid Mechanics and Engineering Thermodynamics (Part I.)
Code:	VEMKGEB143H
Responsible department:	Department of Applied Mechanical Engineering
Responsible department code:	MKAGT
Responsible lecturer:	Dr. András Bálint

Educational objectives:

The students get some basic knowledge about the physical properties of fluids and about the basic laws of the fluid mechanics. They will be able to calculate the engineer's exercises related to the fluid mechanics and get some information about the measuring methods in the fluid mechanics.

Detailed content of the subject:

A short history and the basic elements of the fluid mechanics. Statics of fluid systems and the Pascal's law. The change of the pressure in the space with different acceleration. The form of the mass conservation's law in the fluid mechanics. The form of energy conservation's law in the fluid mechanics. The momentum equation and its applications. One-dimensional ideal flow. The application of Bernoulli's law. Unsteady flow of incompressible fluid. Incompressible fluid flow with friction. Laminar and turbulent flow. The calculation of the velocity-profile the laminar and turbulent flow. The hydraulic-diameter. Incompressible fluid flow in pipelines. The calculation of energy loss, in straight pipes in sudden enlargement and in valves. The characteristics of control valves. The calculation of energy loss in diffusers and in confusers. The characteristics of pipeline systems. Dimensional analysis similarity and measuring methods in the fluid mechanics. Test.

Requirements:

1 test paper on the 14 th week of the semester
