

SUBJECT DATASHEET

Semester:	2011/12/1
Subject:	Integrated biotechniques
Code:	VEMKBMB412B
Responsible department:	Research Institute on Bioengineering, Membrane Technology and Energetics
Responsible department code:	MKBM
Responsible lecturer:	dr. Katalin Bélafiné Bakó

Educational objectives:

To introduce the features of integrated systems in biotechnological processes for the students, moreover to present the possibilities and difficulties of their designing, building and operation.

Detailed content of the subject:

- 1-2. The reasons and aims of integration (e.g. product inhibition), possible connecting points
- 3-4. Demands of the process to integrate into the system
- 5-7. Systems consisting of more unit operations
- 8-9. Application possibilities of membrane processes
10. Integrated system in one unit, requiring membrane separation process:
 - membrane electrodes
 - membrane reactors
- 11-13. Application of in-line and in-situ integration for product recovery, Case studies

Requirements:

Written and/or oral exam in the end of the course.

Required and suggested references:

Integration of membrane processes into bioconversions, Ed. by Bélafi-Bakó, K., Gubicza, L., and Mulder, M., Kluwer, New York, 2000
